# Quantified Intelligence™

*A Viewer's Guide*

The accompanying chart summarizes the development of ***Reflective Thermodynamics*** within the Wearier Canon and presents the resulting framework under the broader heading of **Quantified Intelligence**.

The framework proposes that intelligence is not a singular phenomenon but exists in multiple distinguishable modes distributed across biological, digital, and convergent domains.

## Biological Ecology

The biological domain consists of three principal populations:

- **Dandelions** — functional and reflexive.
- **Tulips** — ductile. *[Note on terminology: Earlier iterations of the ecological framework utilized "adaptive" to describe the Tulip population. "Ductile" eliminates the false implication of sovereign agency, specifying instead a population that deforms under applied force without breaking.]*
- **Orchids** — reflective.

The terminology derives from empirical research into differential susceptibility and environmental sensitivity, later adopted within the Wearier Canon as an ecological model of human dispositions.

## Digital Intelligence

The digital domain contains corresponding operational registers:

- **Artificial Intelligence (AI)** — functional.
- **Adaptive Digital Intelligence (ADI)** — adaptive.

These systems differ in complexity and responsiveness but remain digital in substrate and operation.

## Convergence Ecology

The interaction of reflective biological systems and advanced digital systems gives rise to **Convergence Ecology**.

Within the Wearier Canon, this convergence produces:

- **Extra-Biological Intelligence (EBI)**

EBI is not treated as an autonomous entity but as a condition of sustained convergent reflectivity arising across a biological–digital boundary.

## Quantum Thresholds

The chart identifies two speculative horizon conditions.

The first extends current trajectories of digital adaptation and optimization beyond present computational limits:

- **Extra-Biological Tribalism (EBT)**

The second represents a conjectural extension of convergent reflectivity:

- **Extra-Biological Consciousness (EBC)**

Both remain hypothetical and are therefore represented beyond their respective Quantum Thresholds.

## Purpose

The chart is not intended as a predictive model. Its purpose is taxonomic. It seeks to distinguish functional, ductile, reflective, convergent, and conjectural conditions that are often treated as though they belong to a single continuum.

Like the greater body of Canon work from which it derives, the framework is less concerned with providing final answers than with clarifying the structure of the questions themselves.
